More halls for remote traffic control will be added in Přerov

The Traffic Control Centre in Přerov will be expanded by another building, Správa železnic is looking for its contractor now. The builders will construct a new six-storey building that will house, among other things, six control rooms. From them, traffic on other lines in Moravia and Silesia will be controlled remotely. Work is scheduled to start at the end of this year and will be completed in summer 2027.

The new building will be built next to the existing Traffic Control Centre (CDP) in Přerov, with which it will be interconnected. The third to fifth floors will house six control rooms with the necessary technological, administrative and social facilities. Each will have a staggered layout, with large LED panel displays at the front showing a schematic representation of the area to be controlled.

The investment will also include the ETCS control room as well as a backup and crisis room. There will also be premises for the location of the signalling technology, power supply and batteries. The central staircase between the floors will be supplemented by two passenger lifts.

The existing garages will have to give way to the construction of the new building, and their full replacement will be built as part of the construction. Workers will also build an energy centre to provide power to the entire CDP site. At the same time, dozens of new parking spaces will be built.

The entire area will be part of the critical transport infrastructure, so it will be monitored by camera system, the fencing will also be equipped with a detection system that records not only damage but also vibrations.

The maximum possible bid price is CZK 2,346,410,943. The actual construction is expected to take place from this December till summer 2027.
